## CS Orientation

More Functions

# Decomposition

- What is decomposition?

~~object functional~~  
breaking something into small pieces x

- What are functions?

task

- Examples of daily life functions???

stomach  
eat()

eat (food)  
chewing()

swallowing()

return hungry / full

comes in  
input / argument  
does this  
thing  
change

# As a class, let's define functions...

- For all the employees in our company, calculate their gross pay based on their hours and pay rate.
- Create a function to get number of employees.
- What if you want to make sure this function only returns a valid integer?
- Create function called gross pay that takes the number of employees and calculates gross pay for each.
- Create a main function where the program begins.

# Designing Functions...

```
1 def main():
2     num=getEmployees() #can call getEmployees and return to local variable
3     print(id(num)) #print id of local num
4     calculate(num)
5     #calculate(getEmployees()) #can pass number returned directly to calculate
6
7 def getEmployees():
8     employeeNum = int(input("what is the number of employees: "))
9     #calculate(employeeNum) #maybe not good to have getEmployees() also calculate
10    return employeeNum
11
12 def calculate(num):
13     print(id(num)) #print id of local num
14     for x in range(num):
15         num1 = float(input("for employee number " +str( x+1)+" how much do they get payed: "))
16         num2 = float(input("for employee number " +str(x+1)+" what is there hours: "))
17         print("the pay for employee number "+str(x+1)+" is " +str(num2*num1))
18
19 main()
20
```
