1. What is still unclear from last week? What do you still not understand about arrays and pointers?

2. Create a void function that will assign every element in an integer 2d array to 0, what parameters would we need for this function? How does this function differ between statically versus dynamically allocated arrays?

3. Describe the 3 different ways you can create memory for a 2-d array in a function without causing a memory leak in C++.

4. What are command-line arguments? What is the purpose of argv and argc? What kind of array is in each row of argv? How do you access a row of argv and how do you access one character in argv?
