Winter 2019 CS 161 Exam II FORM 1

Please put your name, ID number and form number on the scantron, and leave the section number blank!!!!

Please use a No. 2 pencil to fill the scantron!!!!

- 1. The name of an array stores the value of the first array element.
- 2. In a function with pass-by-reference parameters, the values of the actual arguments are passed to the function.
- 3. C++ performs array bounds checking, making it possible for you to assign a pointer the address of an element out of the boundaries of an array.
- 4. A recursive function can have at most one base case.
- 5. A recursive function must return a value.
- 6. In some cases, using recursion enables you to give a natural, straightforward, simple solution to a program that would otherwise be difficult to solve.
- 7. You should not assign a non-zero, random integer value to a pointer variable.
- 8. Default arguments can be located argument in the list of function parameters.
- 9. A static array name is a constant pointer because the address stored in it cannot be changed.
- 10. Assume array1 and array2 are the names of two arrays. To assign the contents of array2 to array1, you would use the following statement:
- 11. The elements accessed using two square brackets
- 11. The elements accessed using two square brackets in a two-dimensional array are all the same data type.
- 12. The C string company [12] can hold 12 characters and a '\0' character.'
- 13. The size of a static array is defined at compile time.
- 14. Just like pointers, you can change what any C++ reference refers to at any point.

Multiple Choice (72 pts, 3 pts each)

- 15. If your program makes too many recursive function calls, your program will cause a _____
 - A. compiler error

array1 = array2;

- B runtime error C. syntax error
- D. heap error

fun (int a int

Questions 16-19 are based on the following code:

```
void read_strings(
                                       , int size) {
      for (int i = 0; i < size; i++)
            cin >> array[i];
}
int main(){
      string *arr = new string [5];
      read strings( 1) , 5); //Function call
                (2) //Free memory
      return 0;
}
16. Which of the following is valid at ①?
      A. arr[5]
17. Which of the following will not give you a memory leak at 2?

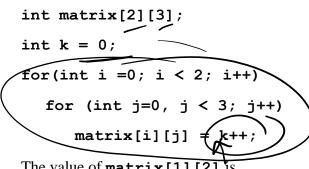

A. delete arr; 

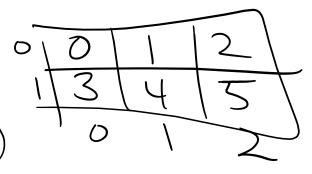

AV 1 AY PY MITTINGS
      B. delete arr [];
                                   -calls destructor
      C.delete [] arr;
      D. delete *arr;
18. Which of the following is valid at ③?
      A. string *array;
      B. string & array;
      C. string arr[];
      D. A) and C;
19. Assume 1 - 3 are correct, is each element in arr filled after calling read strings?
      A. Yes. The memory address of the array has been passed into the function, and therefore we can
      change the content in the original array.
      B. No. We passed the copy of the array into read strings, and thus the content in the
      original array does not change.
20. If a C-style string variable word stores "apple", what will strlen (word) return?
      A. 0
```

Questions 21-25 are based on the following code:

```
void test( ① ){
      // code
}
int main () {
      int a = 0;
      int* ptr1 = &a;
      int** ptr2 = &ptr1;
      test( (2));
      return 0;
}
21. Which of the following should be filled into ② if ① is int &var?
      A. &a or *ptr1
       B. a or ptr1
      \mathcal{C} or *ptr1
      D. &a or ptr1
22. Which of the following should be filled into ② if ① is int *yar?
      'A. &a or *ptr1
      B. a or ptr1
      <u>C</u>. a or *ptr1
      D. La or ptr1
23. Which of the following should be filled into ② if ① is int **war?
      A. *ptr1 or ptr2
      B. &ptr1 or *ptr2
      C. *ptr1 or *ptr2
      D. aptr1 or ptr2
24. Which of the following should be filled into ① if ② is &ptrl?
      A. int var
      R_int *var
      C. int **var
25. Which of the following should be filled into ① if ② is &ptr2?
      A.int var
      B.int *var
      C.int **var
      D. int ***var
```

26. Given the definition and code fragment:

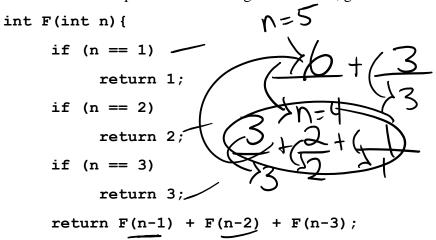

The value of matrix[1][2]

- A. 2
- B. 3

27. What is the output of the following function call, given the function definition below?

}

cout << F(5) << end1;</pre>

A. 5

28. Assuming **ptr** is a pointer variable, what will the following statement output?

cout << *ptr;</pre>

- A. The value in the variable whose address is stored in ptr.
- B. The string "*ptr".
- C. The address of the variable whose address is stored in ptr.
- D. The address of the variable stored in ptr.

Questions 29-32 are based on the following code:

```
//code
}
                               int main(){
    int **two d arr = new int*[3]
    for (int i = 0; i < 3; i++) {
        two d arr[i] = new int[4];
        for (int j = 0; j < 4; j++)
           two d arr[i][j] = 1;
    }
    func ( (2) , 3, 4);
          (3) //Free memory
    return 0;
}
```

29. C++ is row major, meaning that a two-dimensional array will be laid out by rows in memory. How many rows and columns does two d arr have, based on the code above?

A rows, 4 columns

- B. 4 rows, 3 columns
- C. Cannot be defined
- D. None of the above
- 30. According to the code above, which of the following is correct?
 - A. The double pointer two d arr, the row pointers, and the columns are all on the stack
 - B. The double pointer two d arr and row pointers is on the stack, and the columns are on the

C. The double pointer two d arr is on the stack, and the row pointers and columns are on the

D. The double pointer two d arr, the row pointers, and the columns are all on the heap

31. Which of the following is valid for 1 and 2?

A. Dint** array

②two d arr

B. ①int** array

② &two d arr

C. 1 int array 2 two d arr -

D. 1 int array [] [4] 2 two d arr

32. Which of the following will not give you a memory leak or segmentation fault at ③? A. for (int i = 0; i < 3; i++) delete [] two_d_arr[i]; - row pointers delete [] two_d_arr;
B. for (int i = 0; i < 4; i++) delete [] two d arr[i]; C. delete [] two d arr; D. delete [][] two d arr; 33. What is the output of the following code, given the function definitions below? void tester (int a, int &b) } int main () { int x = 2, y = 3; tester(y, x); cout << x << " " << y << endl; return 0; } A. 23 B. 210 34. Which of the following statement is valid C++ code? int ptr = # float *ptr = 10.04; char word1[5] = "werd"; char word2[10] = "computer" world = word2; None of the above 35. Which of the following is a valid C string declaration? A. char array[5] = ``hello''; B. char array [4] = hello"; char array[] = ("hello"; D. None of the above

- 36. Which of the following is a valid C++ array declaration?
 - A. int []array;
 - B. float payments[10.23];
 - \mathbb{C} . string numbers[]; D double scores[25];
- 37. Which of the following statement is true about function overloading?
 - Overloaded functions may have the same name, same parameters, and same return type. verloaded functions may have the same name, same return type, but different parameters. Overloaded functions thay have the same name, same parameters, but different return type.
- 38. What does the following statement do?

- A. Create a variable <u>named and that</u> will store an integer value.
- B. Create a variable named will store an asterisk (*) and an integer value.
- C. Treate a pointer variable named ptr that will store the address of an integer variable.
- D. Create a variable named **per that will store the **NULL** value.

Extra Credit (2 pts each):

39. What is wrong with the following code?

$$*p1 = 11;$$

$$*p2 = 0;$$

$$p2 = p1;$$

delete p1;

A nothing

- B. cannot reuse p2 after deleting it
- C. You have a memory leak, since p2 is not deleted after re-assigned.
- D. B and C
- 40. Which of the following is true about this statement:

 \triangle This statement is illegal in C++.

- B. This statement adds the dereferenced pointer's value to sum, then increments the address stored in the pointer.
- C. This statement increments the dereferenced pointer's value by one, then adds that value to sum.
- D. None of the above

41. What is the output of the following code? int array[2][3];

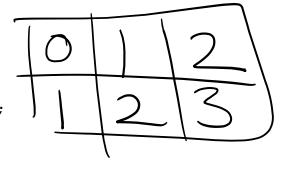

for (int i = 0; i < 2; i++) {

for(int j = 0; j < 3; j++){

array[i][j] = i + j;

cout << array[i][j] << "_____;

}

_cout << endl;</pre>

- 0 1 2 2 3
 - B. 0 1
 - 1 2
 - 2 3
 - C. 0 0 0 1 1 1
 - D. 0 0 1 1 2 2

(H ==

42. True A)/False(B) You may use **strcmp()** to compare all the elements between two C-style strings.

43. True(A)/False(B) Elements in a two-dimensional static array have contiguous memory on the heap.

U when equal +/- when >, <
